“BEYOND THERAPY
BEYOND LIMITS“

ICAROS

OUR STORY

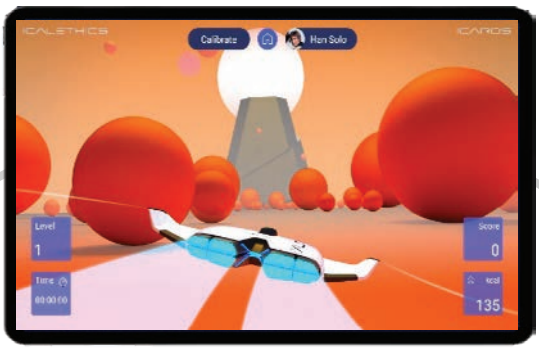

Since 2015, ICAROS has been revolutionizing therapy and rehabilitation in Munich. Our systems combine targeted training with gamification and cutting-edge technology – for a motivating, effective, and entertaining therapy experience.
Our goal? To improve your mobility, accelerate healing processes, and promote long-term health. ICAROS systems are used worldwide in leading therapy centres, rehab clinics, as well as premium wellness and longevity facilities.
With digitalized solutions ”Made in Germany,“ we are setting new standards for training that inspires – and makes you strong, active, and healthy.

ICAROS CIRCLE

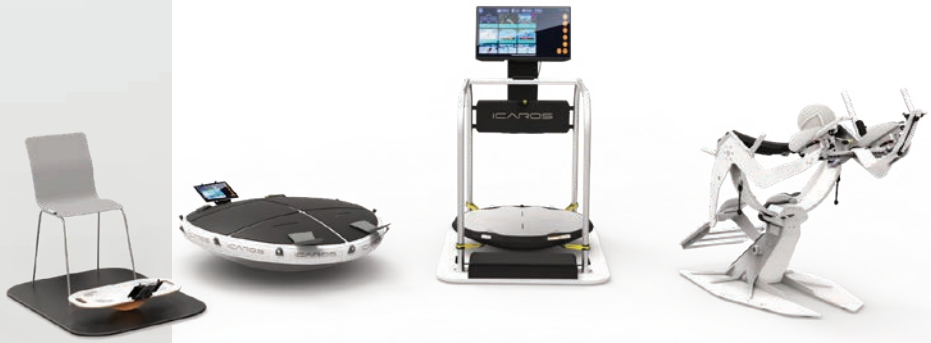

“ICAROS OFFERS HIGHLY EFFECTIVE TRAINING EQUIPMENT FOR IMPROVING STABILITY, COORDINATION, AND BALANCE.”

Domenico Gurzi
Head of the Department of Biomechanics, IBS Health

THE INCLUSIVE ICAROS CONCEPT

Are you looking for a comprehensive and high-quality therapy and training system that adapts flexibly to the needs of your patients and members? The ICAROS Circle combines ICAROS Health, ICAROS Guardian, and ICAROS Cloud for effective rehabilitation at every stage. From supported horizontal core training to dynamic balance exercises in the vertical position, to full-body post-rehabilitation training – the ICAROS Circle offers everything modern therapy requires.

„Can a flying machine help you walk again?“

“The enjoyment I get from ICAROS training motivates me to give my best every time.”

Sandra
Stroke patient

REHABILITATION BEYOND BOUNDARIES

Experience rehabilitation at a new level with ICAROS Health – the innovative training device for orthopaedics and neurology. It enables effective, motivating core and balance training, ideal for physiotherapy, occupational therapy, and remedial exercise. Developed for professional use in therapy, ICAROS Health specifically supports patients with physical impairments. Thanks to individual adjustment and intuitive operation, the training can be optimally tailored to each user.

STABILITY TRAINING MADE EASY

For people with impairments, balance training can be challenging. ICAROS Guardian offers maximum safety, ease of use, and playful training. Progress is immediately available digitally. Ideal for seniors, children, athletes, and rehabilitation patients. Users improve coordination, balance, and reflexes – for greater stability, safety, and mobility in everyday life.

Cognitive-Motor Control

ICAROS I.S.T BOARD

“Turn small movements into real progress.”

SMALL MOVEMENTS, BIG IMPROVEMENT.

The I.S.T. Board enables playful, easily accessible training for balance, reaction, coordination, and mobilization of the lower extremities.
Controlled through precise movements of the feet and legs and combined with a wide range of exergames in the ICAROS app, it becomes a motivating, versatile, and immediately usable training tool for almost any target group.

- Intuitive mobilization

SPORT AND FITNESS

The gamified ICAROS training devices are used by ambitious amateur and professional athletes to enhance their cognitive abilities, strength, and endurance in a unique way.
Whether as a supplement to training or for targeted preparation for the next competition – ICAROS takes performance to a new level.

„THERE IS ABSOLUTELY NO COMPARABLE EQUIPMENT FOR OPTIMISING FULL-BODY COORDINATION.“

Phil Heaton, Ph.D.
Orthopaedic Surgeon, Athlete, and ICARACE Pilot

ENTER A NEW DIMENSION OF FITNESS

The ICAROS Lightning brings fitness into the virtual world and transforms training into a unique experience. While users fly through fascinating VR environments, they specifically strengthen upper body and core muscles, improve reflexes, balance, and coordination. Whether at home or in the gym – the ICAROS Lightning is suitable for both private and commercial use. With its innovative design and award-winning training experience, it is the fitness device of the 21st century.

INTERVIEW

The potential of gamification in training and therapy.

PROF. DR. KLARA BRIXIUS

Prof. (Adjunct) Dr. Klara Brixius is a researcher at the German Sport University Cologne (DSHS) at the Institute of Circulatory Research and Sports Medicine. She completed her doctorate and habilitation in physiology at the University of Cologne. At DSHS, her research focuses on physical interventions for age-related diseases, including age-related muscle loss (sarcopenia). Over the past five years, her research has increasingly focused on the potential of digital therapies to promote physical activity and exercise among older adults.

ICAROS: Dear Professor Brixius, please briefly introduce yourself to our readers. What is your main research focus, and why are you particularly interested in this field?

Prof. Dr. Brixius: The main focus of my research is in the field of sports medicine. In particular, I work on physical intervention methods and exercise therapy for older adults. Since 2020, I have been especially engaged with digital therapy approaches in this context, which is how the collaboration with ICAROS came about. Through the wide range of intervention approaches that we carry out based on exergames, it has become clear to me what potential these approaches have as a complement to existing methods. Multimedia-based movement incentives and the principle of gamification play a decisive role here.

ICAROS: Where do you see the advantages of gamified training, and what role does virtual reality play in this?

In the context of therapy for children and adolescents, playful approaches can create a special kind of motivation [...]

Prof. Dr. Brixius: A key advantage of gamification in digital training lies in offering a different way of engaging with people through “play.” This can create a new kind of motivation for individuals to engage in physical training. Games convey enjoyment, have an intrinsic purpose, and can lead to a “flow” experience*, which shifts attention away from illness and allows for other positively associated movement memories and experiences—something that cannot be conveyed as directly in conventional sports and exercise therapy.
Digital training therefore meaningfully complements and supports conventional sports and movement therapy without replacing it.
In particular, virtual reality technology, when applied here, makes it possible to create a “distraction” from the actual experience of pain through artificial (virtual) environments, as has already been demonstrated scientifically.

ICAROS: In your assessment, which user groups benefit most from gamified training approaches, and why?

Prof. Dr. Brixius: According to the current literature, it can be assumed that older adults in particular—especially those with chronic (pain) conditions, cognitive impairments, or neurological diseases—benefit from gamified approaches. In the context of therapy for children and adolescents, playful approaches can create special motivation, for example to encourage movement, communication with others, and coping with everyday clinical routines.

ICAROS: At the German Sport University Cologne, you have already conducted various studies using ICAROS devices. Could you share some examples and findings?

It is interesting to observe the level of concentration and seriousness with which people engage in the game.

Prof. Dr. Brixius: Over the past few years, we have systematically begun to develop scientific research questions using the ICAROS Health and ICAROS Guardian. Initially, we conducted feasibility studies with healthy individuals to test whether participants could handle the devices and whether the digital therapy approaches were accepted. The applications were well accepted, and the training was associated with enjoyment. Significant improvements were observed in both motor skills and strength capacities. At the same time, it is interesting to observe the level of concentration and seriousness with which people engage in the game.
Building on these studies, we are now focusing on specific clinical conditions, such as chronic non-specific back pain or Parkinson's disease.

In addition, we are currently gaining initial experience with ICAROS devices in the field of pediatric and adolescent dialysis, which we plan to expand into other areas (e.g., pediatric and adolescent oncology).

Significant improvements were observed in both motor and strength capacities.

ICAROS: Finally, which future developments are you most looking forward to?

Prof. Dr. Brixius: I am excited about the further development of multimodal digital training approaches, in which, for example, auditory stimuli are integrated into digital applications alongside the visual system and sense of balance, in combination with movement. I am also looking forward to the next generation of VR systems, in which stepping and arm movements can be integrated into virtual interaction. Additionally, I am curious about developments that may link light influences on the retina to neurotransmitter release in the brain. Augmented reality applications will also be particularly exciting in the context of therapy.

ICAROS: Professor Brixius, thank you very much for the interview!

* **Flow Erlebnis:** A positively experienced mental state of complete immersion (concentration) and total absorption in an activity that seems to proceed almost effortlessly—roughly translated into German as a creative or activity "rush," or functional enjoyment. (From Wikipedia, editor's note)

INTERVIEW

ICAROS-Training in modern rehabilitation.

ICAROS: Dear Professor Winkler, our readers would first like to get to know you a little better. You are a neurosurgeon and a university professor—what led you into this special profession, and which stages of your career as a physician and surgeon were particularly formative?

Prof. Dr. Winkler: At the age of 11, during the grape harvest on my parents' farm, I was run over by an ox-drawn cart loaded with grapes and was seriously injured. In the hospital, I experienced help and was treated by a very compassionate chief physician. Then I had to witness the long dying process of our father over two years; he had to leave my mother alone with us eight children. He, too, received help from the same doctors.

What particularly convinced me [...] was the playful component of your training systems, which ignites ambition [...].

That is why I studied medicine and not music.
In the years that followed, I repeatedly experienced deaths after accidents—also within the close circle of my first music band, which I founded at the age of 13—often due to delayed treatment, as all head-injured patients from South Tyrol had to be transported either to Austria or to the nearest university hospital in Verona. For many, it was too late.
That is why I became a neurosurgeon, with the goal of one day returning to my homeland and establishing a neurosurgical department there. Things turned out differently.

ICAROS: You repeatedly emphasize the importance of continuity in the care of neurological patients—especially during the transition from acute treatment to rehabilitation. Why is this aspect so crucial from your perspective?

Prof. Dr. Winkler: Today, modern neurosurgery enables us to achieve a great deal. In cases of brain injuries and the resulting impairments, a seamless transition into early rehabilitation is extremely important. This was recognized early on in Germany, and in the 1980s and 1990s many centers for neurosurgical and neurological early rehabilitation were established. The principles of neurorehabilitation are based on the neuroplasticity of neuronal networks—that is, on the principle that undamaged neighboring areas can take over the functions of damaged brain regions.

ICAROS: Turning to ICAROS; How did you become aware of our systems, and what particularly convinced you?

Prof. Dr. Winkler: One of your shareholders, Professor Füller from the University of Innsbruck—whom I got to know through my nephew Valentin Winkler from Vienna—drew my attention to your company and arranged a meeting with you.
What immediately convinced me was the playful component of your training systems, which stimulates the ambition of study participants as well as patients. In addition, I very much appreciated the fact that your devices stimulate the nervous system by activating many different sensory systems.

ICAROS: A central element of the ICAROS training systems is so-called gamification—that is, playful motivation throughout the therapy process. How do you evaluate this approach, especially in comparison with classical forms of therapy?

Prof. Dr. Winkler: I consider this playful motivation in the therapy process—so-called gamification, which represents a completely new approach—to be extremely valuable and forward-looking.

ICAROS: In addition to your medical work, you are musically active yourself and speak several languages. In your opinion, what role do making music, handwriting, and drawing play in mental fitness and neuronal health?

Prof. Dr. Winkler: My passion for learning many languages stems from my upbringing in South Tyrol, where one is confronted with at least two languages from birth. My stays in Sweden, the USA, Finland, South Africa, South America, Japan, and more recently Turkmenistan have continually challenged me to expand my linguistic repertoire.
Making music—especially playing wind instruments, such as the saxophone, clarinet, and flute in my case—stimulates para-

sympathetic tone and can thus lower heart rate and blood pressure. The other instruments I play, such as guitar (with singing, which also stimulates the parasympathetic system), drums, and piano, stimulate the nervous system in a similar way, primarily activating the parasympathetic side of the autonomic nervous system and thereby promoting health.
Keeping a diary, which I have practiced for about 40 years, promotes—through the haptic motor activity—the flow of information to be processed by the brain and stimulates memory-relevant neuronal networks.
Drawing has an even more intensified effect in this respect, which is why I create a large portion of the drawings needed for my lectures myself for the microneurosurgical courses I now conduct worldwide as an emeritus professor. The neurosurgeon himself knows best what matters in such drawings.

I consider this playful motivation in the therapy process [...] to be very valuable and future-oriented.

ICAROS: What specific advice would you give to people who want to keep their brains "fit" for as long as possible?

Prof. Dr. Winkler: Think positively and be grateful for everything that can be experienced in good health. For me, the glass has never been half empty, but always half full.
Make music, keep a diary, draw, and keep moving on your own two legs for as long as possible!

ICAROS: Professor Winkler, thank you very much for this inspiring conversation!

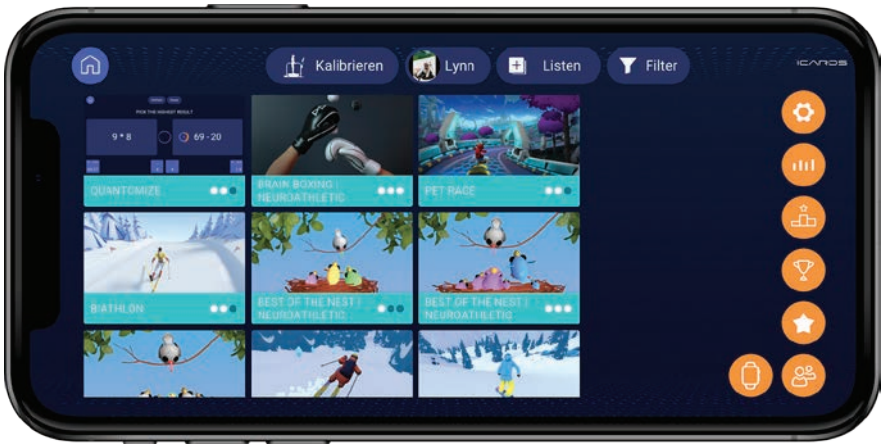

UNIV. PROF. DR. PETER A. WINKLER

Univ. Prof. Dr. Dr. h. c. Peter A. Winkler is a specialist in neurosurgery, emeritus professor, and former head of the Department of Neurosurgery at Paracelsus Medical University Salzburg, and is currently a visiting professor at Charité Berlin. His areas of expertise include functional neuroanatomy, neurotraumatology, and epilepsy surgery, with a strong interest in neurorehabilitation research.

ICAROS APP

EXPERIENCE THE MOTIVATING TRAINING WITH ICAROS.

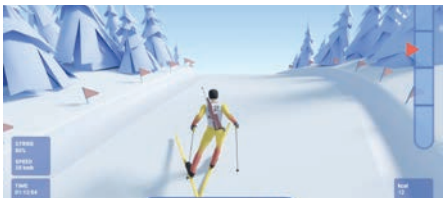

The ICAROS app is compatible with all ICAROS systems and offers a wide range of exergames for rehabilitation and training. It supports cardio, balance, coordination, anticipation, and cognitive-motor training, as well as stability exercises – ideal for re-building motor skills and promoting functional movement patterns.

Selected Exergames

Biathlon

Biathlon trains your endurance and cardiovascular fitness.

XRSki

XRSki strengthens balance and stability and trains anticipation.

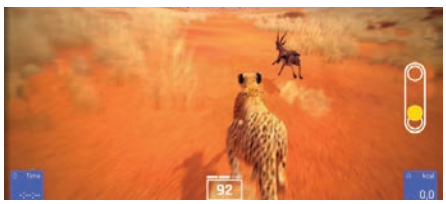

Brainboxing

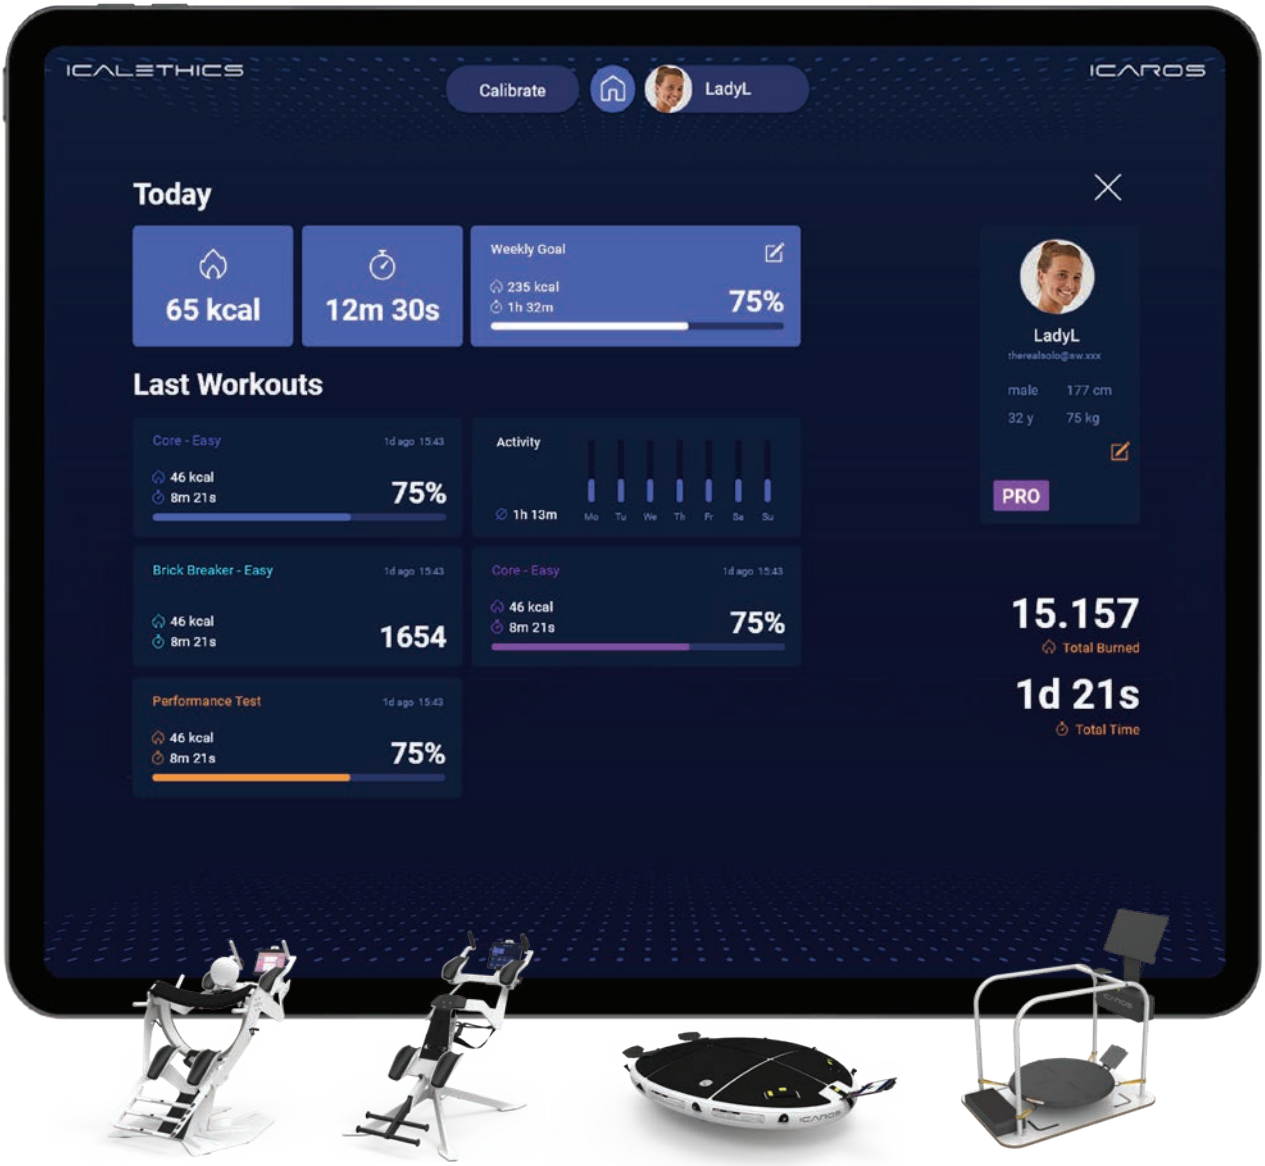

It playfully trains cognitive abilities and reaction skills.

Predator & Prey

Complete an intensive HIIT session and improve movement control.

The ICAROS app is packed with full-body workouts, games, and classes that activate and strengthen all muscle groups. Regular updates with new content and exergames provide even more variety and motivation. Additionally, the app offers tests for coordination, balance, and stability to make therapy results measurable. Therapists and trainers can create personalised playlists for specific goals.

With flexible memberships – monthly, yearly, lifetime – the ICAROS app offers maximum freedom for individual training and therapy.

The ICAROS app makes training and therapy more effective, interactive, and sustainable.

REAL LANDSCAPE

VIRTUAL REALITY

Experience the most impressive landscapes in the world in virtual reality with ICAROS.
Thanks to our collaboration with 3D Reality Maps, you can immerse yourself in the fascinating panoramas of the Engadine, Berchtesgaden, and the Dolomites. Fly over majestic mountains, through vast valleys, and marvel at the beauty of nature – so realistically, as if you were truly there.
This unique experience combines the thrill of flying with breathtaking landscapes, allowing you to discover the world from an entirely new perspective.

Wing suit

Experience the ultimate wingsuit flight and feel the adrenaline rush as you leap from the steep slopes of the Alps. Glide through breathtaking mountain landscapes and enjoy the sensation of absolute freedom.

Discover and Learn

Explore fascinating landscapes while learning exciting cultural and geographical facts. Discover the most impressive landmarks of the Alps from an entirely new perspective.

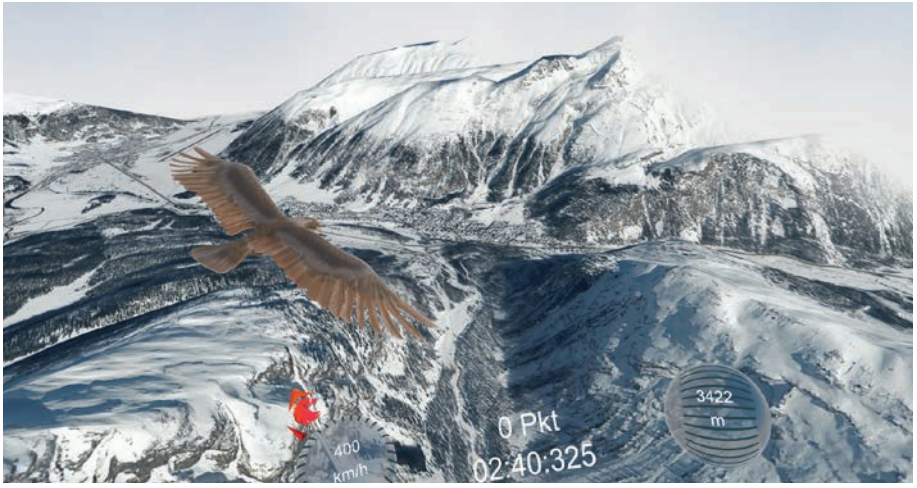

Free flight

Enjoy the beauty of nature without points, time limits, or distractions. Let yourself drift, relax, and fly freely over spectacular landscapes.

Eagle Tour

Take off on a unique tour and experience the Alps from an eagle‘s perspective. Admire majestic peaks, deep valleys, and impressive panoramas – so realistically, as if you were truly there.

N.E.X.T

An ICAROS Success Story

The TV channel BR documented the early stages of a stroke patient's training with ICAROS. Several months later, this patient participated in the ICARACE World Championship. Scan the QR code to watch the full report on YouTube.

"One of the most beautiful moments after my stroke."

Walter
stroke patient

EVERY HEALING JOURNEY IS UNIQUE

The NEXT software, used in combination with the ICAROS Health device, offers a customised exercise programme for individuals suffering from neurological trauma or conditions. NEXT recognises that every healing journey is unique and adjusts the difficulty level for the user based on their individual performance.

The NEXT software combines gamification, virtual reality, and training to support individuals in neurorehabilitation. Its goal is to promote neuroplasticity and focuses on symmetrical balance and coordination training to stimulate paralysed body areas. The training improves core strength, enhancing overall physical performance and stability.

NEXT was developed with the involvement of therapists and patients and uses an algorithm to adjust tasks based on the individual patient‘s progress, providing a tailored rehabilitation approach.

.

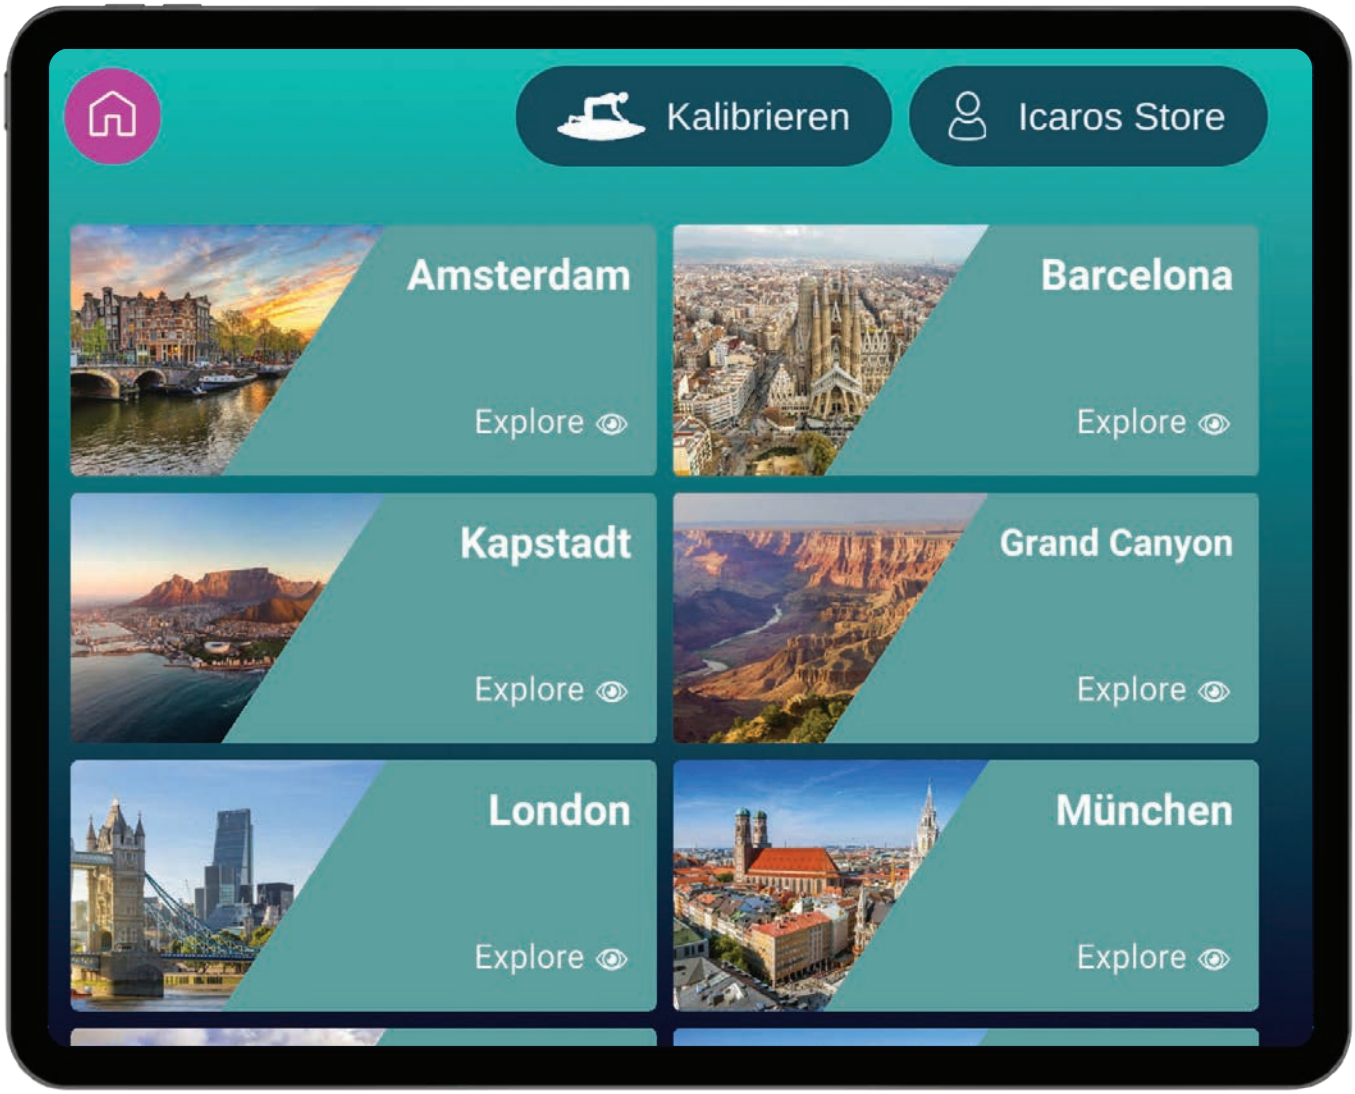

ICAROS EXPLORE

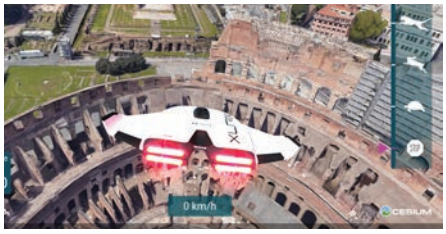

DISCOVER THE WORLD & GET FIT!

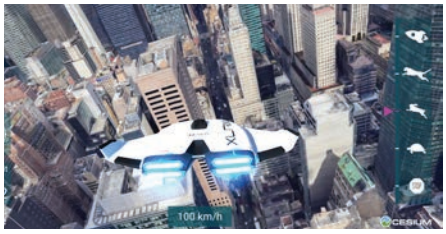

Immerse yourself in a unique exergaming experience with ICAROS EXPLORE! Explore breathtaking landscapes, fly through the skyscrapers of Manhattan, or uncover the hidden secrets of Rome and Venice – all from your ICAROS device. Thanks to Google's 3D Tiles technology, you can experience realistic environments on mobile devices or in virtual reality.

„I‘VE BEEN WAITING SO LONG FOR THIS GAME!“

ABOUT

Julian Reich
CSO

Since 2024, Julian has been responsible for sales at ICAROS as Chief Sales Officer (CSO). As a successful entrepreneur, ambitious athlete, and strong communicator, he leads the sales department with passion and strategic foresight.

Johannes Scholl
CEO

As a co-founder of ICAROS GmbH, Johannes leads the company's operations. As CEO, he brings his creative mind as a designer and his drive as an athlete to ICAROS' development on a daily basis.

We look forward to hearing from you.

STUDIES

The effectiveness of ICAROS devices has been thoroughly researched and validated by renowned scientific institutions and universities. We have conducted numerous studies and trials and collaborated with leading sports and medical universities to explore the potential of ICAROS training for rehabilitation and fitness.

ICAROS HEALTH

Boost in Motivation:
ICAROS encourages further physical activity after rehabilitation.

Muscle Activation:
Similar to plank variations with instability devices.

Muscle Stimulation:
Twice as high as a regular kneeling plank.

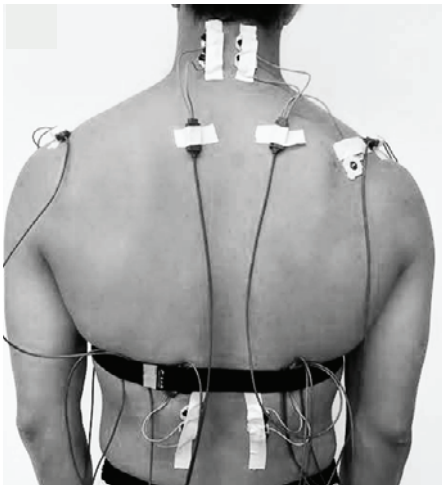

Calorie Burn:
Increased by 30% compared to a regular kneeling plank.

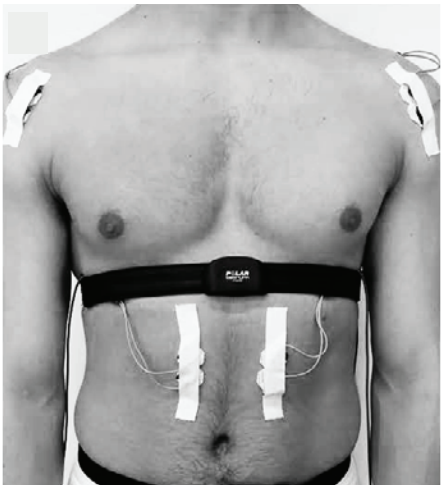

Pleasant Experience:
Participants find the training enjoyable and motivating.

Improved Muscle Functionality:
A significant increase of 25,8%.

Improved Stability:
Significant improvement of 1.4% after training.

Reduced Back Pain:
Most participants experienced a reduction in pain frequency.

Comparison Test at the German Sport University Cologne

ICAROS CLOUD

Cardiopulmonary Improvement:
Improved compared to training on a mat.

Core Strength Increase:
15,85% increase after five weeks.

Higher Energy Metabolism:
5% higher than mat training.

Increased Lactate Concentration:
7% higher after ICAROS Cloud training.

More Fun:
Training on the Cloud is perceived as more enjoyable.

Improved Core Strength:
Significant increase in core strength with the ICAROS app.

Higher Training Willingness:
Although the training is more demanding, participants show a higher willingness to train with the Cloud.

Comparison Test at
